Developers working with complex 32- and 64-bit multi-core systems-on-chip (SoCs) require development tools that leverage the key debug and analysis capabilities built into modern devices. These capabilities are critical to success as they provide the developer with essential visibility into the interworkings of these complex multiprocessing solutions.

Wind River ICE 2 is a high-performance JTAG solution that improves debugging efficiency across a broad range of 32-bit and 64-bit JTAG-, EJTAG-, XDP-, and BDM-enabled devices. Built on a high-performance hardware and software platform, Wind River ICE 2 delivers differentiated value through a highly responsive debugging environment, support for a broad range of processors, and integration with Wind River Workbench, an award-winning Eclipse-based development environment. It supports the debug of complex multi-core designs and provides advanced hardware and software diagnostic and analysis capabilities for 32- and 64-bit single and multi-core systems and SoCs.

Device software developers are under intense competitive pressure to move their projects from system design to production in an environment where schedule slips can be very costly to the project team and the business. In order to complete their projects on time, device software developers require a development tool solution that is dependable and reliable. It should provide visibility into complex hardware and software interactions and enable them to efficiently resolve critical design challenges such as random defects that crash their systems, without having a negative impact on their schedule.

Wind River ICE 2 was designed in concert with today’s leading SoC vendors. Through its tight integration with the debug port on the industry’s leading 32- and 64-bit single core and multi-core SoCs, Wind River ICE 2 provides developers with direct access and control of their target device under development or test. Having this control means that developers will have access to status information for their target at all times, regardless of its operational condition. Since Wind River ICE 2 leverages the debug control block of the microprocessor, it is not dependent on an operating system to work and it can provide the developer with target access even when there is no operating system running on the target.
Benefits
- Simplifies complex system design with visibility into advanced multi-core SoCs that cannot be provided by external logic or bus analyzers
- Enables developers to isolate and resolve challenging multi-core system-level issues
- Provides cost-effective JTAG solution
  - Allows access to multiple targets
  - Enables remote debug
- Protects investment through firmware upgrades and support for a broad set of processors and operating systems
  - Supports ARM, ColdFire Intel, MIPS, and PowerPC architectures
  - Supports VxWorks, Wind River Linux, and open source Linux kernels
  - Optional Trace 2 real-time external trace unit (for supported processors)

The Wind River ICE 2 platform supplies developers with a rich set of features that provide support for a broad range of development capabilities: target connection and control management, operating systems, flash programming, diagnostics, register and memory access, cache support, and run control, which includes hardware and software breakpoints, data and expression breakpoints, stepping, trace support, and synchronized run control.

The Wind River ICE 2 platform is built on a flexible and extensible framework that allows it to scale and extend capabilities to meet the needs of future complex device software development projects.

Basic Run Control Support
Wind River ICE 2 provides developers with a direct connection to their targets. Wind River ICE 2 supports devices from 32-bit microcontroller devices through complex 64-bit multi-core processor SoCs.

Through its support of industry-leading microprocessors, Wind River ICE 2 can connect and manage devices. Wind River ICE 2 provides support for the following:
- Target connection management
- Target reset
- Downloading software to the device
- Flash programming
- Starting and stopping the device
- Stepping (step one statement or instruction into function calls and step over or out of a function)
- Hardware and software breakpoint support
- Access to target registers and memory

Advanced Run Control Support
Target Initialization Control Support
Wind River ICE 2 provides developers with a library of target initialization files for supported SoCs and semiconductor vendor reference design platforms. Developers are able to use these target initialization register files to quickly bring up their hardware and move on to the next stage in the project.

Hardware Diagnostics
Wind River ICE 2 features a suite of hardware diagnostic scripts that provide developers with the ability to run low-level diagnostic routines on their systems for the purpose of validating address and data bus configuration as well as verifying read/write memory. Hardware diagnostics include a comprehensive suite of RAM tests, scope loops, and cyclic redundancy check (CRC) tests.

Cache Support
Wind River ICE 2 provides developers with access to L1 and L2 instruction and data cache for supported processors. This data can be accessed and viewed when Wind River ICE 2 is used with Wind River Workbench On-Chip Debugging or accessed through a rich command set when used with either Workbench’s command shell, host shell, or the Wind River On-Chip Debugging API.

MMU Support
Wind River ICE 2 provides memory management unit (MMU) support for translation lookaside buffer (TLB) configuration and management when ICE 2 is used with operating systems that require the MMU to be enabled, such as VxWorks 6.x, VxWorks 653, and Wind River Linux.

Synchronized Run Control
Wind River ICE 2 provides simultaneous connectivity to up to 16 cores. When used in this configuration, Wind River ICE 2 can synchronously start and stop all cores or just some of them and set cross-correlated breakpoints so that when a breakpoint is hit in one core it can stop that core or all cores in the system.

Internal Trace Buffer Support
Wind River ICE 2 supports the internal trace buffer capabilities provided on supported processors. When used with Wind River Workbench On-Chip Debugging, Wind River ICE 2 can extract trace data and provide a visual representation in the Workbench Trace view. This capability provides developers with visibility into what code executes on the target.

Multi-core Debugging
Wind River ICE 2 was designed with complex multi-core debugging in mind. Wind River ICE 2 features Wind River’s JTAG Server technology, which allows developers to do the following:
- Access a single device on the scan chain, or multiple devices simultaneously, to provide synchronous start and stop
- Set breakpoints within a single microprocessor to halt the execution of multiple microprocessors
- Make JTAG debugging connections to many microprocessors, regardless of their architecture
- Establish and remove connections without affecting any microprocessor or device on the scan chain

Simplified Usage
Wind River ICE 2 provides developers with an LCD panel that displays an IP address and enables developers to better monitor debug status.

High-Performance JTAG
ICE 2’s efficient use of the JTAG interface eliminates slow download times and run control when developing with on-chip debugging microprocessors. Hardware logic that caches common JTAG scan chains improves performance. Wind River ICE 2 combines this capability with a high-speed Gigabit Ethernet connection and a JTAG/EJTAG/BDM interface that provides support for up to 100MHz clock rates.
Remote Debugging
Wind River ICE 2 offers the ability to support remote debugging, when your target system is not located next to your desktop environment. With Wind River ICE 2, your device can be located anywhere, as long as you can connect to it via a network. With its target console port, Wind River ICE 2 supports remote debugging by allowing developers to backhaul the serial output port of the target device via an Ethernet connection.

Scalability
Wind River ICE 2 is a scalable solution that enables developers to add capabilities, such as trace support, through a simple plug-in module. Wind River ICE 2 also provides a broad range of processor support with easy migration from one processor family to another via an interchangeable adapter located at the end of the emulator’s target connection cable.

Target Console Port
Wind River ICE 2 provides a target console port that provides connectivity to the serial port on the target hardware through Wind River ICE 2’s Ethernet interface. The target console port backhauls serial traffic over the network to the developers’ desktops and transports commands back down to the serial interface. With the target console port, developers are able to debug remotely and still have access to serial communication data coming off the target.

Boot Options
Static Boot
In this mode, a default target driver is loaded automatically when the Wind River ICE 2 unit is booted. Multiple target drivers can also be automatically loaded at boot. The whole process is controlled by a bootapps.1st file, similar to an autoexec.bat file. This file can be generated by the Wind River ICE 2 unit or it can be edited on a host and copied into the flash file system.

Dynamic Boot
Dynamic boot is the default mode for the Wind River ICE 2 unit. Without the bootapps.1st file, no applications are loaded. Target drivers can be loaded manually using the Load command or by using Wind River Workbench, which automatically loads the target driver required by the specified target in the Remote Systems Explorer view.

Additional Custom Registers
The Wind River ICE 2 unit supports 32 custom register groups, with a total of 960 custom registers.

Wind River ICE 2 Firmware Update Emulation
ICE 2 can be updated with new firmware via the Firmware Update Utility in Wind River Workbench. After the update, the unit defaults the updated firmware to static boot.

Wind River Technologies
JTAG Server
The majority of CPUs available today make use of the JTAG scan chain to offer access to core components that enable control and configuration of the CPU for debugging. Access through the JTAG scan chain provides visibility and control of internal processor resources (hardware breakpoints and registers) as well as external memory to allow users to download code or program Flash.

Wind River ICE 2, coupled with Wind River’s JTAG Server technology, allows developers to control all the devices that exist in the scan chain via a single tool. With a single interface, this system eliminates the need to separate the scan chain and use precious board real estate for additional JTAG access headers. Fewer headers also means reduced routing complexity and increased board yield rate.

Within the scan chain, Wind River’s leading-edge tools provide the capability to simultaneously or individually debug code on one or more CPUs of the same or dissimilar architectures, whether they are individual components or embedded within a SoC. Wind River ICE 2 also supports multiple debug sessions running on one or more hosts simultaneously.

Wind River ICE 2 High-Performance JTAG
Wind River’s JTAG Accelerator technology enables Wind River ICE 2 to incorporate maximum scheduling efficiency, yielding 100 percent use of the available JTAG scan chain communication bandwidth.

Wind River ICE 2 eliminates slow download times and slow user response to user-run control commands (step in, step out, and single step) when developing with on-chip debugger microprocessors. With our new hardware logic that optimizes JTAG scan chain communications, Wind River ICE 2 dramatically improves performance in development.

Related Products
Wind River Workbench
Wind River ICE 2 is fully compatible with Wind River Workbench, the industry-leading open and extensible development suite. Wind River Workbench On-Chip Debugging is specifically configured to meet the needs of developers early in the device software development cycle—handling initial board bring-up and validation, developing device drivers, incorporating low-level software capabilities, and developing C/C++ applications. This edition offers a feature-rich development suite optimized for the capabilities of JTAG-based debugging using Wind River ICE 2 and Wind River Probe.

Wind River Trace 2
The Wind River Trace 2 external trace module extends the capability of Wind River ICE 2 to include real-time trace capability for supported processors and provide better visibility into hardware/software interaction on the target platform. This enables developers to identify and resolve the most difficult program-flow problems such as when software is randomly crashing the target or when the root cause is not easily found using standard system-level debugging methods via register and memory access. Benefits include the following:

• 1GB trace buffer for storage of instructions and timestamp information
• Ability to capture real-time trace at clock speeds up to 200MHz
• Integration with Wind River Workbench for program-flow monitoring and
user-specified trace configuration and event filtering
- Fast hardware-based buffer post-processing to enable efficient viewing, analysis, and navigation of trace information

**Wind River Connect 2**

Wind River Connect enables developers to connect multiple processors, scan chains, and boards by tying the individual scan chains associated with each processor together onto one continuous scan chain. This process requires complex debugging tools, but it allows developers to simultaneously stop and start the processor's program execution, synchronously restarting the processors as well as reading their internal registers and memory contents.

Wind River Connect provides a unit to take uncommon JTAG scan chains and concatenate up to four independent scan chains together onto a common scan chain.

Features include the following:
- Connection of up to four independent scan chains to a single Wind River ICE 2
- Scan chains that can each run at their own voltage levels, from 1.65V to 3.3V
- Integrated with Wind River Workbench On-Chip Debugging 3.2 and higher versions

**Technical Specifications**

Host OS Support (When Used with Wind River Workbench On-Chip Debugging 3.3 or Wind River On-Chip Debugging API 3.9.4)
- Fedora Core 13, 32-bit x86 and 64-bit x86-64
• Red Hat Enterprise Linux Workstation 6 (Update 0), 32-bit x86 and 64-bit x86-64
• Red Hat Enterprise Linux Workstation 5.0–5.5, 32-bit x86 and 64-bit x86-64
• Red Hat Enterprise Linux Workstation 4 (Update 8), 32-bit x86
• Ubuntu Desktop 10.04, 32-bit x86-32 and 64-bit x86-64
• SUSE Linux Enterprise Desktop 10.2 SP2, 32-bit x86-32
• SUSE Linux Enterprise Desktop 11 SP2, 32-bit x86-32 and 64-bit x86-64
• Solaris 10, 32-bit SPARC/GTK**
• Windows XP Professional with Service Pack 3, 32-bit x86
• Windows 7, 32-bit x86 and 64-bit x86

**Target OS Support**
Wind River ICE 2 provides support for the following target operating systems:
• VxWorks 6.3 and higher
• VxWorks 653
• VxWorks 5.5
• Wind River Linux
• Open source Linux kernels versions 2.6.x.

Customizable target OS awareness capability for Wind River Workbench On-Chip Debugging enables support for other target operating systems.

**Supported Architectures**
Support for specific processors varies by Workbench On-Chip Debugging version and specific JTAG debug unit. For details on currently supported processors, refer to the processor support matrix at www.windriver.com/products/OCD/. Wind River is continually adding new processor support. If you do not see your processor listed, contact your Wind River sales representative.

**Professional Services**
Wind River Professional Services helps companies to reduce risk and improve competitiveness. Our team delivers device software expertise within structured engagements that directly address key development challenges and contribute to the success of our clients. Our track record of timely delivery and in-depth understanding of market and technology dynamics makes Wind River a valuable implementation partner for clients worldwide. Based on our commercial-grade project methodology, service offerings include device design, board support package (BSP) and driver optimization, software system and middleware integration, and legacy application and infrastructure migration.

**Workbench Services**
Whether you select Wind River ICE 2 with Wind River Workbench as a standalone product or as part of our platform solutions, Wind River Professional Services knows how to jump-start your development efforts. Even if you opt for a non-Wind River platform, Linux distribution, host operating system, or target architecture, we can help.

No matter which development environment you use, Wind River Professional

**Wind River Probe is not supported on Solaris hosts.**
Services can extend Workbench to adapt to your needs with the following offerings:

- Extend Workbench processor support
- Extend Workbench target OS support
- Validate Workbench on Linux host environment
- Validate Eclipse plug-ins
- Integrate agents

**Installation and Orientation**

Proper installation and orientation of Wind River Workbench On-Chip Debugging means you won’t waste time solving easily avoidable problems before you can begin your next development project. Wind River offers an Installation and Orientation Service to ensure that your project starts on time and without hassle and delivers the following:

- **Onsite installation:** Guided installation on your hardware and host platform, along with a sample build process, demonstrations, and examples of customizations
- **Hands-on orientation:** Architecture, development file system, adding open source packages, porting drivers, addressing design issues
- **Advice:** Introduction to Wind River support channels and processes, additional services, project review, and consultation

The Wind River Installation and Orientation Service will expedite your path to productivity, allow you to rest assured that we have eliminated a common source of user error, and help you realize the development platform’s full potential.

**Education Services**

Education is fundamentally connected to individual performance as well as the success of a project or entire company. Lack of product knowledge can translate into longer development schedules, poor quality, and higher costs. The ability to learn—and to convert that learning into improved performance—creates extraordinary value for individuals, teams, and organizations. To help your team achieve that result, Wind River offers flexible approaches to delivering product education that best fits your time, budget, and skills development requirements.

**Personalized Learning Programs**

Wind River offers a unique solution to minimize the short-term productivity drop associated with adopting new device software technology and optimize the long-term return on investment in a new device software platform. Wind River Personalized Learning Programs deliver the right education required by individual learners to accomplish their jobs. The programs identify work-related skill gaps; generate development plans, materials, and learning events to address these gaps; and quantify the impact of the development activities for each individual user.

This programmatic, focused, and project-friendly approach to skills development results in a significant increase in the personal productivity of your team, improved efficiency in the processes they employ, and faster adoption of the technology you have purchased. Personalized Learning Programs deliver improved business performance—customers have reported a return on investment ranging from 18 percent to 30 percent over a traditional training approach.

Consult your local Wind River sales representative for more information on Personalized Learning Programs.

**Public Courses**

Wind River’s public courses are scheduled for your geographical convenience. They are conducted over one to five days, using a mixed lecture and interactive lab classroom format that leverages the experience of Wind River instructors and other course participants. Courses provide a fast, cost-effective way for students to become more productive with Wind River technology.

Benefits of public courses include the following:

- A conceptual introduction that orients students to the subject matter
- A selective examination of the details, focusing on the most commonly used areas, or on areas with which users tend to be least familiar
- Personal guidance and hands-on application of individual tools and course concepts
- The chance to grasp device software concepts as well as the fundamental issues involved in real-time design
- The knowledge needed to develop device drivers, perform hardware porting, or develop applications
- Answers to specific questions about topics addressed in the course

Courses of interest to Wind River ICE 2 customers may include Workbench for On-Chip Debugging; General Purpose Platform, VxWorks Edition; General Purpose Platform, Linux Edition; and Workbench for Linux. Consult your local Wind River sales representative or visit education.windriver.com for course schedules and fees.

In addition to these Wind River-sponsored courses, we also offer half-day seminars on a regional basis for processor architecture and OS development training. Refer to education.windriver.com or contact your local Wind River sales representative for information on courses in your area.

**Onsite Education**

If you have a large project team or a number of new users, you may benefit from custom onsite education. Instructors will consult with you and based on the workshop series curriculum determine which topics should be included and emphasized. This type of education offers an opportunity for one-on-one discussions with our instructors about your specific project needs, technical requirements, and challenges—all in the comfort of your own office.

Advantages of onsite education include the following:

- The entire team gains a common knowledge base.
- Onsite education helps ensure that knowledge and skills will transfer from the classroom to the workplace.
- The location saves employees both travel expenses and time away from the office.

**Support Services**

Wind River provides full technical support for our development solutions, including Wind River Workbench On-Chip Debugging, Wind River ICE 2, Wind River ICE, Wind River Probe, Wind River Trace 2, Wind River Trace, Wind River Workbench, VxWorks 6.x, and Wind River VxWorks and Wind River
Wind River is a world leader in embedded and mobile software. We enable companies to develop, run, and manage device software faster, better, at lower cost, and more reliably. www.windriver.com

Linux platforms. Our products are backed by the most comprehensive customer support network in the industry.

Wind River's global support organization is staffed with experienced engineers who have extensive knowledge of Wind River products and device software development. With 10 major support centers and 15 additional support hubs worldwide, our local experts can help diagnose problems, provide guidance, and answer basic "How do I…?" questions.

Support is available 24/7 at our Online Support website or by email at support@windriver.com. The site provides patches, manuals, and the latest errata. Online Support also offers tech tips, application notes, and answers to FAQs. Visit Online Support at www.windriver.com/support, or consult our Customer Support User’s Guide at www.windriver.com/support/resources/csug.pdf.

Wind River experts are also available for phone support during business hours. If you cannot find the information you need through Online Support, contact our global support team.
